## Table 1

Summary of studies proving the role of aspirin in malignant melanoma

Study	Study subjects	Control subjects	Gender of subjects	Drugs used	Conclusion
Joose <i>et al.</i> <sup>[118]</sup> (case control study)	1318	6786	Male and female	Aspirin and other NSAIDs	Reduction in melanoma risk in females with a consistent low dose of aspirin
Curjel-Lewandrowski <i>et al.</i> <sup>[119]</sup> (case control study)	400	600	Male and female	Aspirin and other NSAIDs	Reduction in melanoma risk in both genders following long-term aspirin usage
Gamba <i>et al.</i> <sup>[120]</sup> (observational study)	59,806	Nil	Female	Aspirin	21% Reduction in melanoma risk with aspirin usage and 30% reduction in melanoma risk if aspirin use exceeded 5 years
