

Sodium bicarbonate

From Wikipedia, the free encyclopedia

Sodium bicarbonate [note 1] (IUPAC name: **sodium hydrogen carbonate**) is the **chemical compound** with the formula NaHCO_3 . Sodium bicarbonate is a white solid that is **crystalline** but often appears as a fine powder. It has a slightly salty, **alkaline** taste resembling that of washing soda (**sodium carbonate**). The natural mineral form is **nahcolite**. It is a component of the mineral **natron** and is found dissolved in many **mineral springs**. It is among the **food additives** encoded by **European Union**, identified by the initials **E 500**. Since it has long been known and is widely used, the **salt** has many related names such as **baking soda**, **bread soda**, **cooking soda**, and **bicarbonate of soda**. [note 2] The word *saleratus*, from Latin *sal aeratus* meaning *aerated salt*, was widely used in the 19th century for both sodium bicarbonate and **potassium bicarbonate**. The term has now fallen out of common usage.

History [edit]

The [ancient Egyptians](#) used natural deposits of [natron](#), a mixture consisting mostly of [sodium carbonate](#) decahydrate, and sodium bicarbonate. The natron was used as a cleansing agent like [soap](#).

In 1791, a French chemist, [Nicolas Leblanc](#), produced sodium carbonate, also known as [soda ash](#). In 1846, two New York bakers, John Dwight and Austin Church, established the first factory to develop baking soda from sodium carbonate and [carbon dioxide](#).^[7]

This compound, referred to as saleratus, is mentioned in the famous novel [Captains Courageous](#) by [Rudyard Kipling](#) as being used extensively in the 1800s in commercial fishing to prevent freshly-caught fish from spoiling.^[8]

Production [edit]

Main article: [Solvay process](#)

NaHCO_3 is mainly prepared by the [Solvay process](#), which is the reaction of [sodium chloride](#), [ammonia](#), and [carbon dioxide](#) in water. Calcium carbonate is used as the source of CO_2 and the resultant calcium oxide is used to recover the ammonia from the [ammonium chloride](#). The product shows a low purity (75%). Pure product is obtained from sodium carbonate, water and carbon dioxide as reported in one of the following reactions. It is produced on the scale of about 100,000 tonnes/year (as of 2001).^[9]

InChI <small>[show]</small>	
Properties	
Molecular formula	NaHCO_3
Molar mass	84.007 g mol ⁻¹
Appearance	White crystals
Odor	odorless
Density	2.20 g cm ⁻³ ^[1]
Melting point	50 °C (122 °F; 323 K) (decomposes to sodium carbonate)
Solubility in water	9 g/100 mL 69 g/L (0 °C) ^[2] 96 g/L (20 °C) ^[3] 165 g/L (60 °C) ^[3] 236 g/L (100 °C) ^[2]
Solubility	0.02 %wt acetone, 2.13 %wt methanol @22°C. ^[4] insoluble in ethanol
log P	-0.82
Acidity (pK_a)	10.329 ^[5] 6.351 (carbonic acid) ^[5]
Refractive index (n_D)	1.3344
Structure	
Crystal structure	monoclinic
Pharmacology	
Routes of administration	Intravenous, oral
Hazards	
MSDS	External MSDS
Main hazards	Causes serious eye irritation
NFPA 704	
Flash point	incombustible
LD ₅₀	4220 mg/kg (rat, oral) ^[6]
Related compounds	
Other anions	Sodium carbonate
Other cations	Ammonium bicarbonate Potassium bicarbonate

NaHCO_3 may be obtained by the reaction of carbon dioxide with an [aqueous solution](#) of sodium [hydroxide](#). The initial reaction produces [sodium carbonate](#):

Further addition of carbon dioxide produces sodium bicarbonate, which at sufficiently high concentration will precipitate out of solution:

Commercial quantities of baking soda are also produced by a similar method: soda ash, mined in the form of the ore [trona](#), is dissolved in water and treated with carbon dioxide. Sodium bicarbonate precipitates as a solid from this method:

Mining [edit]

Naturally occurring deposits of nahcolite (NaHCO_3) are found in the [Eocene](#)-age (55.8–33.9 Mya) [Green River Formation](#), [Piceance Basin](#) in [Colorado](#). Nahcolite was deposited as beds during periods of high evaporation in the basin. It is commercially mined using *in situ* leach techniques involving dissolution of the nahcolite by heated water pumped through the nahcolite beds and reconstituted through a natural cooling crystallization process.

Chemistry [edit]

Sodium bicarbonate is an [amphoteric](#) compound. Aqueous solutions are mildly [alkaline](#) due to the formation of [carbonic acid](#) and [hydroxide](#) ion:

Sodium bicarbonate can be used as a wash to remove any acidic impurities from a "crude" liquid, producing a purer sample. Reaction of sodium bicarbonate and an [acid](#) produce a salt and carbonic acid, which readily decomposes to carbon dioxide and water:

Sodium bicarbonate reacts with [acetic acid](#) (found in [vinegar](#)), producing [sodium acetate](#), water, and [carbon dioxide](#):

Sodium bicarbonate reacts with [bases](#) such as [sodium hydroxide](#) to form [carbonates](#):

Related compounds	Sodium bisulfate Sodium hydrogen phosphate
Except where noted otherwise, data are given for materials in their standard state (at 25 °C (77 °F), 100 kPa)	
	✓ (verify) (what is: ✓/✗?)
Infobox references	

3 2 3 2

Sodium bicarbonate reacts with [carboxyl groups](#) in proteins to give a brisk [effervescence](#) from the formation of CO₂. This reaction is used to test for the presence of carboxylic groups in protein. [\[citation needed\]](#)

Thermal decomposition [\[edit\]](#)

Above 50°C, sodium bicarbonate gradually decomposes into [sodium carbonate](#), water and [carbon dioxide](#). The conversion is fast at 200°C: [\[10\]](#)

Most bicarbonates undergo this [dehydration reaction](#). Further heating converts the carbonate into the [oxide](#) (at over 850°C): [\[10\]](#)

These conversions are relevant to the use of NaHCO₃ as a fire-suppression agent ("BC powder") in some dry powder [fire extinguishers](#).

Applications [\[edit\]](#)

Sodium bicarbonate is used in a process for removing paint and corrosion called [sodablasting](#); the process is particularly suitable for cleaning aluminium panels which can be distorted by other types of abrasive. It can be administered to pools, spas, and garden ponds to raise [pH](#) levels. [\[11\]](#) It has weak [disinfectant](#) properties, [\[12\]](#)[\[13\]](#) and it may be an effective [fungicide](#) against some organisms. [\[14\]](#) Because baking soda will absorb musty smells, it has become a reliable method for used-book sellers when making books less malodorous. [\[15\]](#)

Fire extinguisher [\[edit\]](#)

Sodium bicarbonate can be used to extinguish small grease or electrical fires by being thrown over the fire. [\[16\]](#) However, it should not be applied to fires in [deep fryers](#), as it may cause the grease to splatter. [\[16\]](#) Sodium bicarbonate is used in BC [dry chemical fire extinguishers](#) as an alternative to the more corrosive [ammonium phosphate](#) in ABC extinguishers. The alkali nature of sodium bicarbonate makes it the only dry chemical agent, besides [Purple-K](#), that was used in large-scale fire suppression systems installed in commercial kitchens. Because it can act as an alkali, the agent has a mild [saponification](#) effect on hot grease, which forms a smothering soapy foam.

Cooking [\[edit\]](#)

Main article: [Leavening agent](#)

Sodium bicarbonate, referred to as "baking soda", is primarily used in cooking ([baking](#)), as a [leavening agent](#). It reacts with acidic components in batters, releasing carbon dioxide, which causes expansion of the batter and forms the characteristic texture and grain in pancakes, cakes,

quick breads, soda bread, and other baked and fried foods. Acidic compounds that induce this reaction include [phosphates](#), [cream of tartar](#), [lemon juice](#), [yogurt](#), [buttermilk](#), [cocoa](#), [vinegar](#), etc. Sodium bicarbonate can be substituted for [baking powder](#) provided sufficient acid reagent is also added to the recipe.^[17] Many forms of baking powder contain sodium bicarbonate combined with calcium acid phosphate, sodium aluminum sulphate^[18] or cream of tartar.

Sodium bicarbonate was sometimes used in cooking vegetables, to make them softer, although this has gone out of fashion, as most people now prefer firmer vegetables. However, it is still used in Asian and Latin American cuisine to tenderise meats. Baking soda may react with acids in food, including [vitamin C](#) (L-ascorbic acid). It is also used in breadings such as for fried foods to enhance crispness.

Heat causes sodium bicarbonate to act as a raising agent by releasing carbon dioxide when used in baking. The carbon dioxide production starts at temperatures above 80°C. Since the reaction does not occur at room temperature, mixtures (cake batter, etc.) can be allowed to stand without rising until they are heated in the oven.

Neutralization of acids and bases [edit]

Sodium bicarbonate is [amphoteric](#), reacting with [acids and bases](#). It reacts violently with acids in an exothermic reaction. Sodium bicarbonate is not recommended for the clean up of acid spills, as the heat produced increases the reactivity of the acid. The large amount of carbon dioxide produced greatly increases the area of the spill. Also, sodium bicarbonate powder may be used to smother a small fire, as heating of sodium bicarbonate releases carbon dioxide.^[16]

A wide variety of applications follows from its neutralization properties, including reducing the spread of [white phosphorus](#) from incendiary bullets inside an afflicted soldier's wounds.^[19][medical citation needed]

Medical uses [edit]

Sodium bicarbonate mixed with water can be used as an [antacid](#) to treat [acid indigestion](#) and [heartburn](#).^[20] It is used as the medicinal ingredient in [gripe water](#) for infants.^[21]

[Intravenous sodium bicarbonate](#) is an aqueous solution that is sometimes used for cases of [acidosis](#), or when there are insufficient sodium or bicarbonate ions in the blood.^[22] In cases of respiratory acidosis, the infused bicarbonate ion drives the carbonic acid/bicarbonate buffer of plasma to the left and, thus, raises the pH. It is for this reason that sodium bicarbonate is used in medically supervised [cardiopulmonary resuscitation](#). Infusion of bicarbonate is indicated only when the blood pH is markedly (<7.1–7.0) low.^[23]

It is used for treatment of [hyperkalemia](#).[medical citation needed] Since sodium bicarbonate can cause [alkalosis](#), it is sometimes used to treat aspirin overdoses. Aspirin requires an acidic environment for proper absorption, and the basic environment diminishes aspirin absorption in the case of an overdose.[medical citation needed] Sodium bicarbonate has also been used in the treatment of [tricyclic antidepressant overdose](#).^[24] It can also be applied topically as a paste, with three parts baking

soda to one part water, to relieve some kinds of insect bites and stings (as well as accompanying swelling). [25]

Adverse reactions to the administration of sodium bicarbonate can include [metabolic alkalosis](#), [edema](#) due to sodium overload, [congestive heart failure](#), [hyperosmolar syndrome](#), hypervolemic [hyponatremia](#), and [hypertension](#) due to increased sodium. In patients consuming a high-calcium or dairy-rich diet, [calcium supplements](#), or calcium-containing antacids such as [calcium carbonate](#) (e.g., Tums), the use of sodium bicarbonate can cause [milk-alkali syndrome](#), which can result in [metastatic calcification](#), [kidney stones](#), and kidney failure.

Sodium bicarbonate can be used to treat an allergic reaction to plants such as poison -[ivy](#) -[oak](#) or -[sumac](#) to relieve some of the associated itching. [26]

Bicarbonate of soda can also be useful in removing splinters from the skin. [27]

Some alternative practitioners, such as [Tullio Simoncini](#), have promoted baking soda as a [cancer](#) cure, which the American Cancer Society has warned against due to both its unproven effectiveness and potential danger in use. [28]

Personal hygiene [edit]

Toothpaste containing sodium bicarbonate has in several studies shown to have a better whitening [29][29][30][31] and plaque removal effect [32][33] than toothpastes without it.

Sodium bicarbonate is also used as an ingredient in some mouthwashes. It has anti-caries and abrasive properties. [34] It works as a mechanical cleanser on the teeth and gums, neutralizes the production of acid in the mouth and also acts as an [antiseptic](#) to help prevent infections. [[citation needed](#)]

Sodium bicarbonate in combination with other ingredients can be used to make a dry or wet deodorant. [35][36] It may also be used as a shampoo. [37]

Sodium bicarbonate may be used as a buffering agent, combined with table salt, when creating a solution for [nasal irrigation](#). [38]

In sports [edit]

Small amounts of sodium bicarbonate have been shown to be useful as a supplement for athletes in speed-based events, like middle distance running, lasting from about one to seven minutes. [39][40] However, overdose is a serious risk because sodium bicarbonate is slightly toxic, [41] gastrointestinal irritation is of particular concern. [40] Additionally, this practice causes a significant increase in dietary sodium. [[citation needed](#)]

As a cleaning agent [edit]

A paste from baking soda can be very effective when used in cleaning and scrubbing. [42] For cleaning aluminium objects, the use of sodium bicarbonate is discouraged as it attacks the thin unreactive protective oxide layer of this otherwise very reactive metal. A solution in warm water

will remove the [tarnish](#) from silver when the silver is in contact with a piece of [aluminium foil](#).^{[43][44]} A paste of sodium bicarbonate and water is useful in removing surface rust as the rust forms a water soluble compound when in a concentrated alkaline solution.^[45] Cold water should be used as hot water solutions can corrode steel.^[46]

Baking soda is commonly added to washing machines as a replacement for softener and to remove odors from clothes. Sodium bicarbonate is also effective in removing heavy tea and coffee stains from cups when diluted with warm water.

During the Manhattan Project to develop the atomic bomb in the early 1940s, many scientists investigated the toxic properties of uranium. They found that uranium oxides stick very well to cotton cloth, but did not wash out with soap or laundry detergent. The uranium would wash out with a 2% solution of sodium bicarbonate (baking soda). Clothing can become contaminated with depleted uranium (DU) dust, and then normal laundering will not remove it. Those at risk of DU dust exposure should have their clothing washed with baking soda (about 6 ounces (170 g) of baking soda in 2 gallons (7.5 l) of water).^[47]

As a biopesticide [\[edit\]](#)

Sodium bicarbonate can be an effective way of controlling fungus growth,^[48] and in the United States is registered by the [Environmental Protection Agency](#) as a [biopesticide](#).^[49]

Cattle feed supplements [\[edit\]](#)

Sodium bicarbonate is sold as a cattle feed supplement, in particular as a [buffering agent](#) for the rumen.^[50]

In popular culture [\[edit\]](#)

Film [\[edit\]](#)

Sodium bicarbonate, as 'bicarbonate of soda', was a frequent source of punch lines for [Groucho Marx](#) in [Marx brothers](#) movies. In *Duck Soup*, Marx plays the leader of a nation at war. In one scene, he receives a message from the battlefield that his general is reporting a gas attack, and Groucho tells his aide, "Tell him to take a teaspoonful of bicarbonate of soda and a half a glass of water."^[51] In *A Night at the Opera*, Groucho's character addresses the opening night crowd at an opera by saying of the lead tenor, "Signor Lassparri comes from a very famous family. His mother was a well-known bass singer. His father was the first man to stuff spaghetti with bicarbonate of soda, thus causing and curing indigestion at the same time."^[52]

Difference between baking soda and baking powder [\[edit\]](#)

In comparison to [baking powder](#), baking soda is more alkaline and requires an acid to avoid the metallic taste when the chemical change creates sodium carbonate. Baking powder, on the other hand, contains baking soda, a powdered acid and [cornstarch](#). In scientific terms, baking soda is a

[pure substance](#); baking powder is a mixture.^[53]

If baking soda is used in baking, something acidic must be added to avoid the metallic taste of [sodium carbonate](#); but with baking powder, non-acid ingredients such as whole milk or Dutch-processed [cocoa](#) must be added to avoid the over-flavouring of acidic taste.^[54]

Notes [\[edit\]](#)

1. ^ The prefix "bi" in "bicarbonate" comes from an outdated naming system and is based on the observation that there is two times as much [carbonate](#) (CO_3) in sodium bicarbonate (NaHCO_3) and other [bicarbonates](#) as in [sodium carbonate](#) (Na_2CO_3) and other [carbonates](#).
2. ^ In colloquial usage, the names *sodium bicarbonate* and *bicarbonate of soda* are often truncated. Forms such as *sodium bicarb*, *bicarb soda*, *bicarbonate*, *bicarb* or even *bica* are common.
