### There are 3 kinds of investigations that can be made with a Syncrometer;

1. You can detect entities in your body, taken as a whole. For example, mercury aflatoxin, Streptococcus pneumonia, Epstein Barre virus, orthophosphotyrosine, benzene. Such a test is not as sensitive as the organ test, described next, but for this reason allows you to select those entities most abundant in the body and therefore of special significance.
2. You can identify which organs contain a particular entity. For example, the mercury may be in the kidney, the Streptococcus in the joints, and so on. This allows you to embark on a cleanup program for your body in a focused way. The Syncrometer lets you monitor your progress.
3. You can detect entities in products. For example, lead in your household water, thulium in your reverse osmosis water, asbestos in your sugar.

It took an independent research scientist to find the answers. Dr. Clark is an independent research scientist. Dr. Clark has a Bachelor of Arts, Magna Cum Laude, and the Master of Arts with High Honors from the University of Saskatchewan, Canada. Then she studied for two years at McGill University before attending the University of Minnesota and obtaining her doctorate degree in physiology in 1958.

In 1979 she left government funded research and began private consulting on a full time basis. Eleven years later she noticed clues as to the cause of cancer. Today Dr. Clark puts her latest conclusions, her advice for curing cancer, her results and her methods before you. Read and recover.
