Magnesium and Water

Diabetes is disabling, deadly and on the rise and in certain places has reached fifty percent of local populations.

Intravenous, Transdermal, and Oral Magnesium Mineral Therapy

Research suggests that shortfalls in magnesium

Paul Mason, at <http://www.mgwater.com> says, "The cost of magnesium fortification all water-based canned or bottled beverages in California, bringing them up to 90 mg by the addition of magnesium chloride hexahydrate, is about \$42 Million per annum. The savings, as previously reported, are between 24,886 and 100,350 lives per annum California (2). The economic benefit of magnesium fortification can be estimated at \$200,000 per life, if the consumer earns only \$20,000 per year for an additional 10 years. Perhaps an equal number of consumers would have been incapacitated by heart disease (or fear of heart attack), and so their earnings would also have been lost due to the lack of magnesium. There may be a few Billions more savings in medical care and support for incapacitated heart-attack victims. So the economic benefits in California of magnesium fortification would be at least \$10 Billion per annum, and the cost/benefit ratio is better than 1/237. The cost of preventing these 24,886 to 100,350 deaths is between \$418 and \$1,687 each per annum. The cost per consumer is \$1.40 per annum, as obtained by dividing the \$42 Million cost by the 30 Million California consumers."

Because federal, state and local governments are not expected to start using magnesium chloride anytime soon, The International Medical Veritas Association recommends adding small amounts of magnesium chloride to the drinking water in the house, whether from filtered, bottled or distilled processes.
